```
The present invention describes peptides recognising cancer cells with tumour specific cycloxoxic T lymphocytes (CTL). The peptides recognising scancer cells with tumour specific CTLs are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(6) of the above mentioned sequences, particularly those having recognising property due to HLA-A2402 binding CTL, especially having at least 5 amino acids, used for meticine, particularly anticancer agents, derived from antitumour antigenic peptides of lok, src family, SART-1, SART-3 or cyclophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of CTL in cancer patients. The present sequence represents a peptide from

```
The present invention describes peptides recognising cancer cells with tumour specific cytotoxic T lymphocytes (CTL). The peptides recognising cancer cells with tumour specific CTLs are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(s) of the above mentioned sequences, particularly those having recognising property due to HLA-A200 binding CTL, especially having at least 5 amino acid(s) used for medicine, particularly anticancer agents, derived from antitumour antigenic peptides of lck, src family, SART-1, SART-3 or cyclophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of CTL in cancer patients. The present sequence represents a peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antitumour; cancer; cancer cell recognition; antigenic; CTL; lck; src; tumour specific cytotoxic T lymphocyte; anticancer; SART-1; SART-3; cyclophilin B gene; HLA-A2402.

tumour specific cytotoxic Tiymphocytes (CTL). The periods recognising cancer cells with tumour specific CTLs are selected from: (1) peptides of sequences (AAG8066 to AAG8065); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(5) of the above mentioned sequences, particularly those having recognising property due to HLA-A2402 binding CTL, especially having at least 5 amino acids, used for medicine, particularly anticancer agents, derived from antitumour antigenic peptides of lck, src family, SART-1, SART-3 or cyclophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of CTL in cancer patients. The present sequence represents a peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to peptides which are partial sequences of \operatorname{src}/\operatorname{Ick} family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 30, DB 4; Length 13;

                                                                                                                                                                                                                                                                                                                                                         The present invention describes peptides recognising cancer cells with tumour specific cytotoxic T lymphocytes (TTL). The peptides recognising cancer cells with tumour specific (TLEs are selected from: (1) peptides of sequences (AAG68066 to AAG68069); (2) peptides containing the above mentioned sequences; (3) peptides having 70 % or more of homogeneity with the above mentioned sequences; and (4) peptides with one or more deleted, substituted, added or inserted amino acid(s) of the above mentioned sequences, particularly those having recognising property due to HIA-A2402 binding CTL, especially having at least 5 amino acids, used for medicine, particularly anticancer agents, derived from antitumour antigenic peptides of lck, src family, SART-1, SART-3 or cylophilin B genes. The antitumour peptides have cytostatic activities. The peptides are used for the treatment of cancer. The peptides cause activation of the concer patients. The present sequence represents a peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                  New peptides for recognizing cancer cells with tumor specific cytotoxic T lymphocytes and for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antitumour; cancer; cancer cell recognition; antigenic; CTL; lck; src; tumour specific cytotoxic T lymphocyte; anticancer; SART-1; SART-3; cyclophilin B gene; HLA-A2402.

```
Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                               The present invention relates to peptides which are partial sequences of src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptides which are partial sequences of src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 30; DB 4; Length 13; 30.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides which are partial sequences of src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                      Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                         The present invention relates to peptides which are partial sequences of src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to peptides which are partial sequences of src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Src protein; 1ck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 30; DB 4; Length 13; 30.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                        Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to peptides which are partial sequences o \operatorname{src/loc} family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.

```
Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New modified human Factor VIII molecule being substantially non-
immunogenic or less immunogenic than non-modified human Factor VIII,
useful in preparing a composition for treating e.g., Gaucher's disease.
                                                                                                                                                                                                                                                                 The present invention relates to peptides which are partial sequences o src/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Potential human MHC class II binding human Factor VIII peptide #562.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human Factor VIII, non-immunogenic; immunogenic, T-cell epitope; MHC class II; ligand; vaccine; immunogenicity; Gaucher's disease.
                                                                                                                                                                                                                                                                                                                                                                                Length 13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to peptides which are partial sequences of stor/lok family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                                                    Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.

vivo. The modified human Factor VIII molecule comprises specifically altered amino acid residues compared with the non-modified parental molecule, where the altered amino acid residues cause a reduction or an elimination of one or more of the T-cell epitopes, which act in the parental non-modified molecule as MHC class II binding activity peptide is useful for the manufacture of the modified Factor VIII molecule or a vaccine in order to reduce immunogenicity to Factor VIII in a patient. The modified Factor VIII molecule is useful in preparing a composition for treating e.g., Gaucher's disease. This sequence represents a human Factor VIII peptide with potential human MHC class II binding activity of

Screening, diagnosing and/or treating breast cancer by detecting a change in expression or activity of a breast cancer membrane protein (BCMP) polypeptide or encoding nucleic acid molecule.

Claim 1; SEQ ID NO 120; 81pp; English

The present invention describes a method of screening for and/or diagnosing breast cancer in a subject, and/or monitoring the effectiveness of breast cancer therapy. The method comprises detecting and/or quantifying in a biological sample obtained from the subject a breast cancer membrane protein (BCMP) polypeptide and a nucleic acid molecule. Also described: (1) an antibody, its functionally-active fragment, derivative or analogue, that specifically binds to one or of the BCMP polypeptide, (2) a diagnostic kit comprising a capture reagent specific for an BCMP polypeptide, reagents and instructions for use; (3) a method for screening for anti-breast cancer agents that interact with the BCMP polypeptide, comprising contacting the polypeptide with a candidate agent, and determining whether or not the candidate agent interacts with the polypeptide; (4) a method for screening for anti-breast cancer agents that modulate the expression or activity of an BCMP

Sequence 16 AA;

ö
polypeptide or the nucleic acid molecule cited above, comprising comparing the expression or activity of the polypeptide or nucleic acid molecule, in the presence and absence of a candidate agent or in the presence of a control agent, and determining whether the candidate agent causes the control agent, and determining whether the candidate agent causes the expression or activity of the polypeptide or nucleic acid molecule to change, and (5) an agent identified by the method of (3) or 4(4), which interacts with the polypeptide or causes the expression or activity of the polypeptide, or the expression of the nucleic acid molecule to change. BCMPs have cytostatic activities, and can be used in vaccines. The BCMP polypeptide, nucleic acid molecule, antibody, agent or their derivatives, are useful in the manufacture of a medicament for the treatment of breast cancer, where the composition is a vaccine. The present sequence represents a BCMP peptide which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteomics for controlling or eliminating isotope effects during fractionation of chemically equivalent but isotopically distinct compounds. The isotope facilitates intelligent data acquisition, also the isotope effect is reduced by eliminating deuterium from. The present sequence represents a peptide used in the exemplification of the specification, used to compare the resolution caused by reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isotope coding agent useful in proteomics comprises functional group and isotopic linker containing at least three heavy non-deuterium isotopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isotope; intelligent data acquisition; reverse phase chromatography;

The linking group contains an acid-cleavable N-phenylene-thic urea derivative group. The use of the novel spectrometric analysis of proteins, is claimed as a reagent for the mass spectrometric analysis of proteins, especially for identifying proteins or protein functions in samples containing one or more proteins. The expression levels in samples containing one or more proteins. Isotopically labelled tags are designated 'ICAT's' (isotope coded affinity tags). An acid-labile group can serve as a pre-determined cleavage site for acid-induced cleavage of the affinity label, e.g. to facilitate releage on an affinity column to make the residue attached to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the protein smaller and/or make the processing more efficient. The tags remaining on the protein fragments after acidolysis have a markedly reduced molecular weight and higher isotope density. The affinity tags also have higher solubility than prior art analogs. This sequence represents a marker peptide which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New, preferably isotopically labeled affinity tag compounds, useful in analyzing proteins by mass spectrometry, comprise affinity ligand, protein reactive group and acid-cleavable thiourea derivative linker.
                                                                                                                                                                                                                                                                                                                                                 affinity tag; N-phenylene-thio urea; ICAT; isotope coded affinity tag.

The invention relates to identifying a modification in a polypeptide by a method involving peptide sequencing. The method involves (a) identifying a set of one or more candidate sequencing including sequence information to potentially corresponding to an unmodified variant of the polypeptide of serious sequence; (b) sequencing at least a portion of one or more peptide of known sequence; (b) sequencing at least a portion of one or more peptide of derived from the polypeptide to identify a sequence information for the comparing the identified sequence rag with sequence information for the set of candidate sequence to identify a candidate sequence containing the identified sequence tag; and (d) calculating the difference between at least one subsequence mass of the identified andidate sequence. Modifications that may be identified include mutations, additions, deditions, and posttranslational containing modifications. Possible sample materials include cells, body fluids, and environmental samples such as soil, water and air samples. Sequences containmental samples such as soil, water and air samples. Sequences containing the dismutase (SOD), identified in an exemplary experiment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Bovine Serum Albumin indexed peptide database peptide #299

```
The invention relates to a novel method of mass spectrometry. The method comprises mass analysing the first molecules in a first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture. The invention further relates to: generating an index to the first mixture. The invention further relates to: generating an index for use in identifying molecules of biological origin by mass respectivemetry by accurately determining the masses or mass to charge ratio of the comprising peptides resulting from the digestion or fragmentation of a polypeptide or protein; determining a first physico-chemical property of the molecules comprising peptides; and optionally determining a second, third, fourth and/or fifth physico-chemical property of the molecules comprising peptides; and optionally determining a mass analyser for accurately determining the mass to charge ratio of the first molecules of the basis of at least the first physico-chemical property and the accurately determined mass to charge ratio of the first molecules of the basis of the basis of the second, third, fourth and/or fifth physico-chemical property. The method and spectrometer are useful in protein dentification, protein quantitation, protein quantitation.

The pass spectrometry method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method of mass spectrometry, useful in protein identification and quantitation, by mass analyzing the first molecules in the first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture molecules in the first mixture.

```
The invention relates to a novel method of mass spectrometry. The method comprises mass analysing the first molecules in a first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture. The invention further relates to: generating an index to the first mixture. The invention further relates to: generating an index of for use in identifying molecules of biological origin by mass consisting molecules of protein; determining the masses or mass to charge ratio of the comprising peptides resulting from the digestion or fragmentation of a polypeptide or protein; determining a first physicotomelar property other than mass or mass to charge ratio of the molecules comprising peptides; and optionally determining a second, third, fourth and/or fifth physicotomelar property of the molecules comprising peptides; and optionally determining a mass spectrometer comprising a mass analyser of comprising peptides; and a mass spectrometer comprising a mass analyser of the molecules and means for identifying the first molecules of the basis of at least the first physicothemical property and the accurately or determined mass to charge ratio of the first molecules and optionally on the basis of the second, third, fourth and/or fifth physicothemical property. The method and spectrometer are useful in protein dentification, protein quantitation, protein quantitation, protein quantitation, protein mass spectrometry, proteomics, genomics and bioinformatics. This sequence converted by the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       quantitation, by mass analyzing the first molecules in the first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method of mass spectrometry, useful in protein identification and

The invention relates to a novel method of mass spectrometry. The method comprises mass analysing the first molecules in a first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture. The invention further relates to: generating an index for use in identifying molecules of biological origin by mass spectrometry by accurately determining the masses or mass to charge ratios of molecules comprising peptides resulting from the digestion or fragmentation of a polypeptide or protein; determining a first physicochemical property other than mass or mass to charge ratio of the molecules comprising peptides; and optionally determining a second, third, fourth and/or fifth physico-chemical property of the molecules comprising peptides; and a mass spectrometer comprising a mass analyser of a least the first physico-chemical property of the basis of determining the mass to charge ratio of the basis of the basis of the basis of the second, third, fourth and/or fifth physico-chemical property and the accurately or the basis of the second, third, fourth and/or fifth physico-chemical property. The method and spectrometer are useful in protein capacitical in protein quantitation, proteases, high-resolution mass spectrometry, proteomics, genomics and bioinformatics. This sequence represents a peptide from an indexed peptide database created by the novel mass spectrometry method of the invention. . 0 Gaps ö Length 16; 0; Indels Score 30; DB 7;

and characterization.

This invention describes a novel method of analysing complex mixtures of biopolymers that contain peptide bonds by fragmentation, immobilisation, cselective release of bound fragments, labelling, separation of labelled fragments according to physicochemical properties and detecting the label. The biopolymers are peptides, proteins, or their derivatives; and the binding fragments are amino acids, (lipo- or glyco-)peptides, proteins, or their derivatives; and their derivatives. Typical enzymes for used in the method are compliming tragments are mino acids, (lipo- or glyco-)peptides, PNA or their derivatives. Typical enzymes for used in the method are compliming to the linker depend on the nature of the terminal amino acid, e.g. thiols are reacted through dithiols; Glu and Asp are reacted with acarbodimide; Arg is reacted with glycard and this coupled to amino in the homoserine lactone with cyanogen bromide and this coupled to amino in the linker. Reagents for blocking specific monomers are e.g. acid anhydrides or chlorides, aldehydes etc., most preferrably acetyl chloride or chlorides, aldehydes etc., most preferrably acetyl chloride or cirraconic anhydride, and the most preferrably acetyl chloride or cirraconic anhydride, and the most preferrably in the number of isothiocyanatobenzene. The method is used in proteome and peptidome analysis. The method allows a significant reduction in the number of components that need to be characterised (and thus saves time and money), without a significant loss of information. immobilisation site-cleavage site-link, where the immobilisation site is selected from the group consisting of an epitope tag, a linker to a solid surface, a metal chelating site, and a magnetic site, or a combination thereof, and the cleavage site is selected from the group consisting of a protease cleavage site (ADJ77982), a photocleavable linker, a restriction site, a chemical cleavage site and a thermal cleavage site, or a combination thereof. The present bovine albumin peptide was used to
                                                                                                        Novel reagent for simultaneously identifying and determining levels of expression of cysteine-containing proteins in normal and perturbed cells.
                                                                                                                                                                                                           The present invention relates to reagent compounds (C1) for identifying and determining the levels of expression of cysteine-containing proteins in normal and perturbed cells. The reagent compounds have the formula:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for the quantitative analysis of a protein. The method involves hydrolyzing a first test sample in water containing 90% or more of 18-0 (an isotopic labeling element). hydrolyzing a second sample in water containing 90% or more of 16-0, mixing the hydrolyzed substance of the first and second samples, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              quantitative analysis; HPLC; electrospray ionization; mass spectroscopy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein quantitative analysis method related tagged BSA peptide #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Quantitative analysis of protein, by hydrolyzing test sample and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to reagent compounds (C1) for identifying and determining the levels of expression of cysteine-containing proteins in normal and perturbed cells. The reagent compounds have the formula: immobilisation site-cleavage site-link, where the immobilisation site is selected from the group consisting of an epitope tag, a linker to a solid surface, a metal chelating site, and a magnetic site, or a combination thereof, and the cleavage site is selected from the group consisting of a protease cleavage site (ADJ77982), a photocleavable linker, a restriction site, a chemical cleavage site and a thermal cleavage site, or a combination thereof. The present sequence was used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                Novel reagent for simultaneously identifying and determining levels of expression of cysteine-containing proteins in normal and perturbed cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  for analysing cysteine-containing protein expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel affinity tag compounds (preferably isotopically labelled with carbon-13 and optionally nitrogen-15)

Consisting of an affinity ligand residue covalently bonded to a protein reactive group via a linking group. The linking group contains an acid-cleavable N-phenylene-thio urea derivative group. The use of the novel tag, in isotopically labelled form, is claimed as a reagent for the mass spectrometric analysis of proteins, especially for identifying proteins or protein functions in samples containing one or more proteins. The affinity tag can also be used to determine the relative protein affinity tag can also be used to determine the relative protein carpression levels in samples containing one or more proteins.

Catenopically labelled tags are designated /ICAT's' (isotope coded finity tags). An acid-labile group can serve as a pre-determined caleavage site for acid-induced cleavage of the affinity label, e.g. to facilitate release on an affinity column to make the residue attached to the protein smaller and/or make the processing more efficient. The tags reduced molecular weight and higher solubility than prior art analogs. This sequence also have higher solubility than prior art analogs. This sequence represents a fragment of bovine albumin which is used in the method of
                                                                                                                                                                                                                           ö
carrying out quantitative analysis of the liquid mixture by liquid chromatography/electrospray ionization-mass spectrometry (LC/ESI-MS). The method enables the quantification of proteins in large-scale proteomics, and trace amount of proteins present in an organism can be quantified accurately and efficiently. This sequence represents a peptide fragment used in the protein quantitative analysis method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 preferably isotopically labeled affinity tag compounds, useful in

```
The invention relates to methods for identification of compounds which interact with the insulin receptor beta chain at specific loci; and/or after the conformation of the cytoplasmic kinase domain (KDD). In addition the invention relates to simple non-peptide compounds that behave as agonists for the insulin receptor and enhance the effect of insulin on this receptor. The processes may be used for identification of compounds which can stimulate the uptake of glucose in calls or lower blood glucose levels. The identified compounds can be used in the compound (TER16998) binds, a series of 14 peptides the CKD to which a compound (TER16998) binds, a series of 14 peptides ("ryan peptides", AAW65642-55) were synthesised. These peptides were chosen to correspond to distinct surface elements of the CKD made evident by the X-ray structure. Collectively, these 14 peptides cover 85 per cent of the surface-exposed residues. These peptides were tested for their ability to inhibit the activation of insulin receptor by TER16998
                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying materials which modulate insulin receptor kinase activity useful for screening for compounds which can enhance glucose uptake in cells or lower blood glucose levels.
                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide #14 derived from the CKD of the insulin receptor beta chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      modulator;

The invention discloses analytical reagents (e.g. trifunctional synthetic reagents) which can be used for reducing the complexity of peptide mixtures. The method labels peptides at a specific amino acid residue and then selectively enriches only those peptides containing the labelled amino acid. The compound have the formula of immobilisation site-cleavage site-link. The immobilisation site is chosen from an epitope tag, a linker to a solid surface, a metal chelating site, a magnetic site and a specific oligonuclectide sequence, or their combination, the cleavage site is chosen from a protease cleavage site, a photocleavable linker, a set is cite is chosen from a protease cleavage site, a photocleavable linker, a restriction enryme cleavage site, a chemical cleavage site and a thermal cleavage site, or their combination. The compounds are useful for simultaneesite, or their combination. The compounds are useful for simultaneously identifying and determining the levels of expression of cysteine-containing proteins; in normal and perturbed cells. The advantage is that these reagents allow rapid and compasses, accurate relative quantification of peptide amounts using masses spectrometry, can be achieved. The sequences given in AbG9593-AbG96244 are examples of the peptide tags used to isolate cysteine-containing the nearest electron the peptides isolated using the nearest clearage. ö specific Rabbit; bovine; analytical reagent; trifunctional; peptide mixture; enrichment; immobilisation site; cleavage site; link; epitope tag; protease; cysteine-containing; perturbed cell; mass spectrometry; peptide tag; BSA; bovine serum albumin; PEPTag; APEPTag; IPEPTag; affinity peptide encoded tag; immobilised peptide encoded tag; chicken; beta-lactogobulin; GAPDH; glyceraldehyde-3-phosphate dehydrogenase; a-lactalbumin; ovalbumin; yeast. Wei J,

In the interaction describes a novel pharmaceutical composition for treating or preventing arthritis or other degenerative disease which comprises a polypeptide a collagen type IX alpha 1 chain NC4 domain or a biologically active fragment having antiarthritic, antiinflammatory and immunosuppressive activity in combination with a carrier. The invention describes two methods for recovering a polypeptide having anti-arthritic or anti-inflammatory activity. The first method comprises isolating a mixture comprising a GAG-peptide and a polypeptide having amilecular weight of less than 30000 ba yearlolysis from connective tissue, weight of less than 30000 ba yearlolysis from connective tissue, colypeptide. The second method comprises incubating connective tissue in an autolysis medium that provides a buffeeted pH range of 2.5-8.5 for a time and under conditions sufficient to release a GAG-peptide and autolysis medium, separating the GAG-peptide and polypeptide from the autolysis medium, separating the GAG-peptide from the GAG-peptide and polypeptide from the autolysis medium, separating the polypeptide from the GAG-peptide and polypeptide from the autolysis medium, separating the polypeptide from the GAG-peptide from the autolysis medium, separating the polypeptide from the GAG-peptide from the croovering in the covered anti-arthritic or anti-inflammatory polypeptides are useful for inducing cartilage formation or for preparing a medicament for the condition of arthritis or other musculoskeletal ö Pharmaceutical composition for treating or preventing arthritis or other degenerative disease in an individual, comprises a polypeptide comprising a collagen type IX alpha 1 chain NC4 domain. degenerative condition or for tolerizing an individual to at least one antigenic component of cartilage. This sequence represents a fragment of bovine serum albumin. This invention describes a novel pharmaceutical composition for treating Gaps ö arthritis; antiarthritic; antiinflammatory; immunosuppressive; musculoskeletal disease; degeneration; bovine serum albumin. The method accurately seas mass analysing the first molecules in a first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture. The invention further relates to: generating an index for use in identifying molecules of biological origin by mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      spectrometry, proteomics, genomics and bioinformatics. This sequence represents a peptide from an indexed peptide database created by the novel mass spectrometry method of the invention.

```
A method of mass spectrometry, useful in protein identification and quantitation, by mass analyzing the first molecules in the first mixture and accurately determining the mass to charge ratio of the first molecules in the first mixture.
                                                                                                     mass spectrometry; peptide index; protein identification; protein quantitation; protease; high-resolution mass spectrometry; proteomics; genomics; bioinformatics; Bovine Serum Albumin.
Bovine Serum Albumin indexed peptide database peptide #50

Genoscope; Whitehead Institute Centre for Genome Research;
Submitted (FEB-2004) to the EMBL/Genbank/DDBJ databases.
-!- CAUTION: The sequence shown here is derived from an
EMBL/Genbank/DDBJ whole genome shotgun (WGS) entry which is
preliminary data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

New immunosupressant DNA and protein - useful for inhibition and treatment of autoimmune diseases caused by lymphoid cell protein-tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein kinase homologue; human; PKH; diagnosis; therapy; cancer; AIDS; autoimmune disorder; inflammatory disorder; reproductive defect; asthma; diabetes mellitus; infertility; ovulatory defect; endometriosis;
                                                                                                                                                                                                                                                                                                        This sequence is the Lymphoid cell protein-tyrosine kinase (Lck) SH3 domain of the invention. The DNA and protein are useful as immune suppressants, and are useful for inhibition and treatment of autoimmune diseases caused by Lck analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding a human protein kinase homolog useful for preventing, diagnosing and treating cancer, autoimmune/inflammatory disorders and reproductive defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gorgone GA, Azimzai Y;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor antigen peptides which induce tumor-specific cytotoxic T-cells and polynucleotides encoding them for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to peptides which are partial sequences of stor/lck family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer
                                                                                                                                                                                                                                                                                                Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lymphoid cell protein-tyrosine kinase; Lck; SH3 domain; inhibitor; immune suppressant; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

expression such as cancers (e.g. lymphoma, melanoma and cancers of the breast lung and prostate), autoimmune/inflammatory disorders (e.g. AIDS, asthuma and diabetes mellitus), and reproductive defects (e.g. AIDS, infertility, ovulatory defects, endometriosis and polycystic ovary syndrome). The DNA may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of PKH by expressing inactive proteins or to supplement the patients own production of PKH polypeptides. Additionally, the DNA may be used to produce PKH, according to standard recombinant DNA methodology, by inserting the mucleic acids into a host cell and culturing the cell to coppess the protein. Conversely, antisense nucleic acid molecules may be administered to down regulate PKH expression by binding with the cells own PKH genes and preventing their expression. The DNA, and antisense sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and become an expression and all and culture to the presence of similar nucleic acid sequences in samples, and become an expression and presence of similar nucleic acid sequences in samples, and become an expression and presence of similar nucleic acid sequences in samples. also be used to study the expression and function of PKH polypeptides and their role in metabolism. The PKH polypeptides may be used as antigens in the production of antibodies against PKH and in assays to identify modulators (agonists and antagonists) of PKH expression and activity. The anti-PKH antibodies and PKH argonists may also be used to down regulate PKH expression and activity. The anti-PKH antibodies may also be used as diagnostic agents for detecting the presence of PKH polypeptides in This sequence represents a human protein kinase homolog (PKH) of the invention. The PKH sequences may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PKH expression such as cancers, autoimmune/inflammacry disorders and reproductive defects. They may be used to treat disorders associated with decreased PKH Claim 1; Col 47-50; 38pp; English

and treating cancers, autoimmune/inflammatory disorders and Human protein kinase proteins and homologs, useful for preventing, reproductive disorders.

Claim 1; Col 47-50; 38pp; English.

The present sequence is human protein kinase homolog-3 (PKH-3). Human protein kinase homologs (PKH) and their CDNA molecules are used in the prevention, diagnosis and treatment of diseases associated with increased or decreased expression of PKH. Examples of such disorders include, cancer (e.g. adenocarcinoma, melanoma and bone, breast and liver cancer), suttoimmune/inflammatory disorders (e.g. Acquired Immune deficiency Syndrome (AIDS), anaemia, asthma, crohn's disease and multiple sclerosis) and reproductive disorders (e.g. tubal disease, ectopic pregnancy and polycyptic oversy syndrome). PKH, its catalytic or immunogenic fragment are used for screening libraries of compounds in any of the drug screening techniques. PKH nucleic acids are used to generate thyridisation probes useful in mapping the naturally occurring genomic sequences. PKH are also used as antigens in the production of antibodies gainst protein kinases (PK) and in assays to identify modulators of PKH expression and activity. PKH is also used in protein therapy

This invention describes a novel protein kinase homologue (PKH)

polypeptides which have cytostatic, immunosuppressive, antiinflammatory,
antiallergic, antisabimatic, antianteamic, antiarteriosclerotic,
antithyroid, dermatological, antidabetic, nephrotropic, antigout,
thyromimetic, nootropic, osteopathic, antiarthritic, antirhematic,
contralmological, antidace, antivirent antirhematic, antiprocessal, antiparasitic and antihelminic activity. The polypeptide
attiprocessal, antidace, antivirent antihelminic activity. The polypeptide
is used for treating a disease or condition associated with decreased
expression of functional PKH. The polypeptide is used to screen for
agonists and antagonists of PKH which can also be used in disease
treatment. The polypeptide and polymucleotide are used for treating
acquired immunodeficiency syndrome, allergies, ankylosing spondylitis,
andidosis, ansemia, astham, atherosclerosis, autoimmune hasenolytic
contact dermatitis, crohn's disease, atopic dermatitis, dermatomyositis,
andidosis, ansemia, astham, atherosclerosis, autoimmune haemolytic
contact dermatitis, crohn's disease, atopic dermatitis, dermatomyositis,
antenia, autoimmune thyroiditis, bronchitis, cholecystitis, dermatomyositis,
contact dermatitis, crohn's disease, atopic dermatitis,
anteniamune thyroiditis, bronchitis, cholecystitis, dermatomyositis,
contact dermatitis, osteoporosis, pandrome, multiple sclerosis,
hypereosinophilia, irritable bowel syndrome, multiple sclerosis,
conteartritis, osteoporosis, pandrome, multiple sclerosis, thrombocytopenic
purpura, ulcerative colitis, uveitis, werner syndrome, complications of
cancer, haemodialysis, and extracorporeal circulation, viral, bacterial,
including tubal disease, ovulatory defects, and endometriosis,

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human clasmostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, gastrointestinal disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The ditup molecules may also be used in generic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germine gene therapy. The present sequence represents a ditup protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

modulates Tlymphocyte activation. The method comprises contacting at Cell comprising an A-raf-1 or TCPTP/PTNN2 polypeptide with a compound, where the A-raf-1 or TCPTP/PTNN2 polypeptide is encoded by a nucleic acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and a 415-amino acid sequence given in the specification. The method of the invention has immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, proliferation and differentiation, and apoptosis, using either cell lines or primary cells. The A-raf-1 or 'TCPTP/PTN'D proteins may be used as drivation and migration, eng for the treatment of diseases in which modulation of the immune response is desired such as delayed type hypersensitivity reactions, asthma, allergies, graft versus host disease, and acute and chronic inflammation. Modulators of lymphocyte activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a compound that modulates T lymphocyte activation, useful for monitoring changes in cell surface marker expression, comprises contacting a T cell comprising an A-raf-1 or TCPTP/PTPN2 polypeptide with a compound.

The compound is an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compromidiating the expression of the human Lck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Lck polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating diseases or conditions associated with aberrant expression or activity of Lck, such as hyperproliferative
                                                                                          Human lymphocyte specific tyrosine kinase (Lck) polypeptide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 41; DB 8; Length 363; 100.0%; Pred. The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGs). The nucleic acids and polypeptides are useful for determining the level of a nucleic acid or polypeptide in a biological sample, for determining the level of a nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant nucleic acid or polypeptide sequences in a biological sample and for taising antibodies. A pharmance trom which the variant has been varied by alternative splicing in a second the variant has been varied by alternative splicing in a second the variant has been varied by alternative splicing in a second composition comprising antibodies. A pharmaceutical composition comprising the level of the original sequence from which treating diseases (e.g. cancer) that can be ameliorated or cured by increasing or decreasing the level of the encoded protein. The nucleic cancer or a predisposition to cancer, for evaluating the state or aggressiveness of cancer disease, in basic research, for understanding the physiological function of the original TiG in targeting or the physiological function of the original TiG in targeting or the physiological functions of the original stage in which call cycle of pharmaceuticals, for various cancer stages in which cell cycle is noncornal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of therapy. The polypeptides are useful for identifying compounds capable of modulating endothelial differentiation and proliferation, as well as to modulate apoptosis either ex vivo or in vivo. The sequences presented in Alenghance Novel nucleic acid sequence, which is an alternative splicing variant of tumor involved genes, useful for detecting cancer, predisposition to cancer, for evaluating cancer state and in gene therapy for treating Romano C, Bernstein J; Claim 4; Page 68-69; 180pp; English. diagnosing, treating or preventing autoimmune or inflammatory disorders (e.g. AIDS, allergy or anemia), multiple sclerosis, osteoarthritis, New human kinases and phosphatases and polynucleotides, useful for cancer or hepatitis.

Claim 1; SEQ ID NO 1; 424pp; English.

The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The KPP polypeptides, polymucleotides, gonists and antegonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental retardation, neurological disorders including Alzheimer's disease and Parkinson's disease and inflammatory disorders such as Crohn's disease and diabetes mellitus and finally, viral, bacterial, fungal, parasitic, protozoan or helminthic infections. Furthermore, the polynucleotides encoding KPP may be useful for creating transgenic animals to model human disease, as well as during gene therapy procedures. The current sequence is that of the human KPP protein of the invention.

Sequence 458 AA;

셤 à

```
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal complex to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence with a subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   but was obtained in electronic form directly from WIPO at

or numen polynucleotices or a polynucleotice and sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a comprising the vector, a method for identifying a nucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of the polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound to a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the compound that activity in an animal of one or more of the polymeptides or their antibodies. The polymucleotide or the compound that complying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polymeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed specification, which has a pharmaceutical did not form part of the printed specification.
The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                        Identifying ligand binding to inactive conformation of target protein kinase (T) comprises contacting the conformation modified (T) which contains reactive group at binding site, with ligands and detecting kinase-ligand conjugate formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention describes a crystal (1) of a protein-ligand complex (C) comprising a truncated lymphocyte kinase (Lck) and a ligand, where (1) CC effectively diffracts X-rays for determination of atomic coordinates of (C) to a resolution of greater than 5.0 angstroms, and truncated Lck comprises a sequence (S1) of residues 225-508 of a 508 amino acid comprises a sequence (S1) of residues 225-508 of a 508 amino acid comprises a sequence (S1) of residues 225-508 of a 508 amino acid comprises a sequence (S1) of residues 225-508 of a 508 amino acid comprises a sequence (S1) is useful in an inhibitor screening assay and to comprise that would be useful in an inhibitor screening assay and to comprise a sequence of that would be useful as therapeutics for diseases or symptoms of diseases comprise activity of one or more enzymes. The inhibitors identified by the methods may also be useful for inhibition of kinase activity of any enzyme comprising greater than 90%, alternatively greater than 85%, or alternatively greater than 50% and thibitions the biological activity of any enzyme that binds ATP and thus for treating disease or disease symptoms mediated by any enzyme that that binds ATP. The inhibitors are useful in inhibiting kinase activity and mammal, particularly a human e.g., cancer, autoimmunological, metabolic, inflammatory, infection, (bacterial, viral, yeast, fungal, etc.), central enzyme that service of the

This invention relates to novel protein complexes of the tumour necrosis factor-alpha (TWR-alpha) signalling pathway. Specifically, it refers to methods for preparing these complexes comprising at least two component proteins, as well as screening methods to identify modulators of the pathway, which include antibodies, agonists and antagonists thereof. The present invention describes a protein complex and kit that are useful for diagnosing, prognosing or treating chronic inflammatory diseases such as rheumatoid arthritis and inflammatory bowel disease, infectious diseases such as such as septic shock and bacterial infections; neurological diseases such for gene therapy purposes. In particular, the invention further provides stRNA-ollgomucleotides useful for inhibiting protein expression for in vitro or cell culture assays. This polypeptide is a human protein that can be used in combination with other proteins provided in the specification to form novel complexes of the TNF-alpha signalling pathway as stroke-induced inflammation in neurons; neurodegenerative diseases and cancer. Accordingly, these complexes can be used for the development of pharmaceutical compositions that exhibit antiinflammatory, antiarthritic, antirheumatic, cytostatic and antibacterial activities and can be used New protein complex comprising at least one first and second protein of the Tumor Necrosis Factor-alpha(TNF-alpha)-signaling pathway, useful for diagnosing or treating inflammation, neurological diseases, infectious Human protein of a TNF-alpha signalling pathway protein complex SeqID 3. protein complex; tumour necrosis factor-alpha signalling pathway; INF-alpha; chronic inflammatory disease; rheumatoid arthritis; inflammatory bowel disease; infectious disease; septic shock; bacterial infection; neurological disease; stroke-induced inflammation; neurodegenerative disease; ancer; antiinflammatory; antiarthritic; antirheumatic; cytostatic; antibacterial; gene therapy; human.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a novel method of altering the activity of the protein kinase A (PKA) signaling pathway in a cell that comprises altering the extent of phosphorylation of one or more PKA substrates, or Ainase substrates downstream in the PKA signaling pathway. Pharmaceutical compositions containing a nucleic acid molecule that encodes a PKA substrate, or fragment, precursor or functionally equivalent variant, where the sequence is modified to alter its susceptibility to phosphorylation by PKA can be used for treating a disorder exhibiting abnormal PKA signaling activity, immunosuppressive disorder or proliferative diseases. They can be used for treating e.g. HIV infection, AIDS, common variable immunodeficiency or cancers. Conditions in which upregulation of the PKA pathway is required, such as autoimmune disease, e.g. systemic lupus erythematosus, may also be treated. The present sequence represents a PKA substrate, wherein the substrate is in the Src-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Altering the activity of protein kinase signaling pathways, used for treating immunosuppressive disorders, e.g. AIDS, proliferative disorders, e.g. cancers or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              family, preferably Lck, Fyn, Src, Yes, Fgr, Lyn, Hck Blk, Yrk, c-tkl,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a crystalline polypeptide (I), comprising the catalytic domain of human Lymphocyte Cell Kinase (Lck) protein. Lck is a Src-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. The present sequence is the full-length sequence of human Lck (1-509). (I) is useful for identifying a compound which is an inhibitor of human Lck protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AIDS; acquired immunodeficiency syndrome; human immunodeficiency virus; HIV-related disorder; differential expression; drug screening; viral replication modulation; diagnosis; prognosis; predisposition; anti-HIV; gene therapy; antisense therapy; human; proto-oncogene Tyr protein kinase LCK; enzyme.
                    Human; protein co-ordinate data; Lymphocyte Cell Kinase; Lck; enzyme; Src-family protein tyrosine kinase; T-cell; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                           New crystalline polypeptide comprising ligand binding domain or cataly domain of Lck protein, for determining three-dimensional structure of catalytic domain of Lck, has predetermined unit cell parameters.
                                                                                                                                                                                                                                                                                                                                  Loew A;

The invention relates to a method of identifying a compound useful in the treatment of AIDS (acquired immunodeficiency syndrome) or an HIV (human immunodeficiency virus) related disorder. The invention involves assaying the ability of a test compound to modulate the activity or expression of 26 human proteins. These proteins and nucleic acids encoding them (ADB40473) are differentially expressed in tissues relating to AIDS or an HIV-related disorder compared to their expression in normal tissues. The invention also relates to the use of the compounds condulate viral replication in a cell and to treat a patient with AIDS or an HIV-related disorder. The invention further discloses methods for the diagnostic evaluation and prognosis of various HIV-related disorders, and for the identification of individuals exhibiting a predisposition to such conditions. The modulatory compounds identified using the method of the invention may be small organic molecules, the invention are useful in diagnosing, preventing or treating AIDS or HIV-related disorders. The present sequence represents a human protein which is differentially expressed in AIDS or HIV-related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                             Identifying a compound capable of diagnosing, preventing or treating AIDS or an HIV-related disorder comprises assaying the ability of the compound to modulate e.g. 1414, 1481 or 1553 nucleic acid expression or polypeptide activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a method of identifying a candidate p21 or p53 pathway modulating agent. This comprises providing an assay system comprising a modulator of p21 or p53 (MP2153) polypeptide or nuclaic presence the system provides a reference activity, and detecting a test agent-biased activity of the assay system, wherein a difference between the test agent-biased activity and the reference activity identifies the test agent chises a candidate p21 or p53 pathway modulating agent. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with abberrant expression or activity of the p21 or p53 pathway, such as a human MP2153 protein sequence of the invention.
                                                                                                                                                                                                                        Identifying a candidate p21 or p53 pathway modulating agent using an assay system having a modulator of p21 or p53 (MP2153) polypeptide or nucleic acid, useful for diagnosing or treating cancer, such as colon or

The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside
                                                                   The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or thugal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating diseases or conditions associated with aberrant expression or activity of Lck, such as hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                    .;

The specification describes a method for identifying protein kinase inhibitors that preferentially bind to the inactive conformation of a target protein kinase. The inhibitors are identified by locking the target protein kinase in an inactive conformation, and using Tethering to identify inhibitors preferentially targeting the inactive conformation. The method of the invention is useful for identifying a ligand which binds to an inactive conformation of a target protein kinase. The present sequence represents the human Tyr kinase Lck. Lck variants were used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein kinase inhibitor; inactive conformation; Tethering; Tyr kinase;
                                                                   polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Lck polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying ligand binding to inactive conformation of target protein kinase, by contacting inactive conformation of target with ligand candidates specific to target, detecting formation of kinase-ligand conjugate and identifying ligand.
                 moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Lck
linkage i.e. a phosphorothioate linkage, at least one modified sugar

```
characterizing a compound which modulates Streaming will be characterizing a compound which modulates Streaming whether cells, contacting cells with test compound and determining whether phenotype of cells is changed as compared with phenotype of cells not expressed with above nucleic acids, where difference in phenotype of cells is changed as compared with phenotype of cells not expressed with above nucleic acids, where difference in phenotype of cells not compound modulate SFK activity. Also described: (1) a compound modulate SFK activity. Also described: (2) a pharmaceutical composition (PC1) containing (1), and a carrier, adjuvant or vehicle. (1) is useful as a medicament, particularly for the treatment of diseases, which are at least in part caused by a Src family kinase. (1) and PC1 are useful for producing a medicament for the treatment of diseases, which are at least in part caused by a Src family kinase. (2) aparticularly by a dysfunction of a Src family kinase, in particular cancer, hypercalcemia, restenosis, osteopoxosis, osteoparthritis, symptomatic treatment of bone metastasis rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying compound which modulates Src family kinase (SFK) activity, by contacting cells expressed with SFK or mutated SFK with test compound, where change in phenotype of cells indicates that test compound modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            asthma, ischemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rejection or allergic rhinitis. The present sequence represents human Lok
kinase, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method (M1) for identifying, selecting and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammatory bowel disease, multiple sclerosis, psoriasis, lupus, graft versus host disease, T-cell mediated hypersensitivity disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hashimoto's thyroiditis, Guillain-Barré syndrome, chronic obstructive pulmonary disorder, contact dermatitis, Paget's disease, asthma, ischen or reperfusion injury, allergic disease, atopic dermatitis, transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 8; 114pp; English.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite. The dithp collection minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 272 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conclusions as also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ö,

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 52623; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

The inversion relates to an instance in the sequence listing or in the condess an amino acid sequence exhibiting at least 85% sequence that encodes an amino acid sequence exhibiting at least 85% sequence it that encodes an amino acid sequence in the sequence listing or in the ortholog alignments of Figure 1, a nucleic acid, which is the reverse of the nucleotide sequence in (a), a nucleic acid, which is the reverse of the nucleotide sequence order which is the reverse of the sequence order of (a) or a nucleic acid capable of the reverse of the sequence order of (a) or a nucleic acid capable of bybridizing (a-c), under conditions that permit formation of a nucleic acid duplex at a temperature of 40-48 degrees C below the melting temperature of the nucleic acid daying a regulatory sequence construct (comprising a first nucleic acid having a regulatory sequence construct (comprising a host cell comprising the isolated nucleic acid molecule that is flanked by except on a second nucleic acid having the sequence of the isolated nucleic acid having the sequence of the isolated of call or sequence exhibiting at least 85% sequence identity to those cited above, introducing an isolated polypeptide comprising an amino acid sequence exhibiting at least 85% sequence identity to those cited above, introducing an isolated nucleic acid in a seample, a host cell or organism comprising the nucleic acid molecule, a plant generated from the plant comprising the nucleic acid molecule (where the plant material or seed, a plant (plant call, plant material or seed) comprising the plant) improving plant characteristics as compared to a wild type plant), improving plant the nucleic acid sequence, and a transcaric plant a and a transgenic plant having a gene construct (comprising the nucleic encoding a component operably linked to a plant promoter so that the component is ectopically overexpressed in the transgenic plant). The transgenic plant exhibits faster rate of growth, greater fresh of dry weight of maturation, greater fruit or seed yield, higher tolerance to pH, higher tolerance to pH, higher tolerance to low purepurate concerning, which does not to low nitrogen concentration than a progenitor plant, which does not invention relates to an isolated nucleic acid molecule modifying

```
contain the progenitor construct, when the transgenic plant and progenitor plant are cultivated under identical environmental conditions, where the component is any one of the polypeptides cited above. The nucleic acid molecules are useful for producing transgenic plants with improved characteristics. The present sequence is an ortholog of a protein encoded by a plant nucleic acid (CDNA) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                abiotic stress tolerance; transgenic plant; plant; cereal; agriculture.

```

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotidee. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress and the inventions. The present sequence is used in the exemplification of their invention New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress. protein-tyrosine kinase (EC 2.7.1.112) tkl [similarity] - chicken
N.Alternate names: kinase-related transforming protein (tkl); T-cell surface antigen ass
C;Species: Gallus gallus (chicken)
C;Date: 16-Jun-2000 #sequence_revision 16-Jun-2000 #text_change 05-Oct-2004
C;Accession: A42126; A39939
R;Chow, L.M.; Ratcliffe, M.J.; Veillette, A.
Mol. Cell. Biol. 12, 1226-1233, 1992
A;Title: tkl is the avian homolog of the mammalian 1ck tyrosine protein kinase gene.
A;Reference number: A42126; MUID:92186654; PMID:1545804
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Note: sequence extracted from NCBI backbone (NCBIN:88831, NCBIP:88833)
